Population 2.1

About the data

Knowing the size, growth rate, and age distribution of a country's population is important for evaluating the welfare of the country's citizens, assessing the productive capacity of its economy, and estimating the quantity of goods and services that will be needed to meet its future needs. Thus governments, businesses, and anyone interested in analyzing economic performance must have accurate population estimates.

Population estimates are usually based on national population censuses, but the frequency and quality of these vary by country. Most countries conduct a complete enumeration no more than once a decade. Pre-census and postcensus estimates are interpolations or extrapolations based on demographic models. Errors and undercounting occur even in high-income countries; in developing countries such errors may be substantial because of limits on the transport, communications, and other resources required to conduct a full census. Moreover, the international comparability of population indicators is limited by differences in the concepts, definitions, data collection procedures, and estimation methods used by national statistical agencies and other organizations that collect population data.

Of the 148 economies listed in the table, 125 (about 85 percent) conducted a census between 1989 and 1999. The currentness of a census, along with the availability of complementary data from surveys or registration systems, is one of many objective ways to judge the quality of demographic data. In some European countries registration systems offer complete information on population in the absence of a census. See *Primary data documentation* for the most recent census or survey year and for registration completeness.

Current population estimates for developing countries that lack recent census-based data, and pre- and post-census estimates for countries with census data, are provided by national statistical offices, the United Nations Population Division, or other agencies. The standard estimation method requires fertility, mortality, and net migration data, which are often collected from sample surveys, some of which may be small or limited in coverage. These estimates are the product of demographic modeling and so are also susceptible to biases and errors because of shortcomings of the model as well as the data. Population projections are made using the cohort component method (see box 2a in the introduction to this section).

The quality and reliability of official demographic data are also affected by the public trust in the government, the government's commitment to full and accurate enumeration, the confidentiality and protection against misuse accorded to census data, and the independence of census agencies from undue political influence.

Definitions

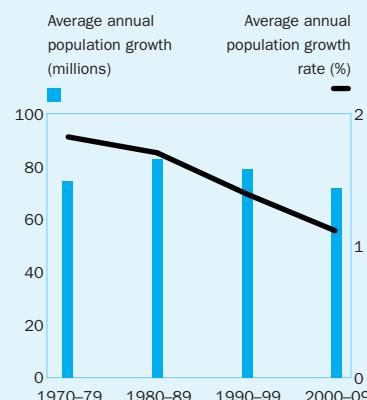

- **Total population** of an economy includes all residents regardless of legal status or citizenship—except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin. The indicators shown are midyear estimates for 1980 and 1998 and projections for 2015.
- **Average annual population growth rate** is the exponential change for the period indicated. See *Statistical methods* for more information.
- **Age dependency ratio** is the ratio of dependents—people younger than 15 and older than 64—to the working-age population—those aged 15–64.
- **Population aged 65 and above** is the percentage of the total population that is 65 or older.
- **Women aged 65 and above** is the ratio of women to men in that age group.

Data sources

The World Bank's population estimates are produced by its Human Development Network and Development Data Group in consultation with its operational staff and resident missions. Important inputs to the World Bank's demographic work come from the following sources: census reports and other statistical publications from country statistical offices; demographic and health surveys conducted by national agencies, Macro International, and the U.S. Centers for Disease Control and Prevention; United Nations Statistics Division, *Population and Vital Statistics Report* (quarterly); United Nations Population Division, *World Population Prospects: The 1998 Revision*; Eurostat, *Demographic Statistics* (various years); South Pacific Commission, *Pacific Island Populations Data Sheet 1999*; Centro Latinoamericano de Demografía, *Boletín Demográfico* (various years); and U.S. Bureau of the Census, International Database.

The rate of population growth is slowing faster than absolute growth is

Source: World Bank staff estimates.

The global population growth rate has declined rapidly since the 1970s, but the number of people added each year started to decline—gradually—only in the early 1990s. In the first decade of the 21st century the world's population is projected to grow 1.1 percent a year, adding 70 million people annually.
